Freshwater wetlands are a significant habitat type commonly encountered in the SWNS bioregion; this includes bogs, fens, marshes, shrub- and forest-dominated swamps, and seasonal forest vernal pools, with bogs being the most common (Figure 1). The ‘Atlantic Plateau Bog’, an uncommon type of raised bog, is found only in the southern coastal regions of the province, in Yarmouth and Shelburne County. They rise up sharply from the surrounding terrain to heights of up to four metres with the top nearly flat like a plateau and often with a number of pools (National Wetlands Working Group 1997).

Among the most productive and diverse of all ecosystems, the ecological diversity of the bioregion’s freshwater wetlands support a diverse assemblage of wildlife, including a number of Nova Scotia’s rare and endangered species. Globally rare species of Atlantic Coastal Plain Flora (ACPF) can be found in lake-edge wetlands; these wetlands are among the most ecologically significant wetlands in the province. Additionally, many bird species depend on freshwater wetlands throughout the year for nesting, brood rearing, migration, and wintering habitat (NS EHJV 2008). Freshwater wetlands also perform vital ecological and social functions, including carbon storage, water quality improvement through natural filtration, a natural sink for pollutants, and the control or abatement of flooding, drought, and soil erosion (Davis & Browne 1996; Nova Scotia Environment 2012c), providing an estimated $7.9 billion worth of benefits in ecosystem services to Nova Scotians annually (Government of Nova Scotia 2011).

Eastern Mountain Avens, a flowering herbaceous perennial plant, is one of the most globally endangered plants in the Canadian Maritimes. The species occurs in Nova Scotia as a highly disjunct population in moist to wet sphagnum peat in sparsely treed coastal peatlands on Digby Neck and Brier Island (COSEWIC 2000). Eastern Mountain Avens is threatened primarily by habitat loss and degradation (caused by the draining of peatlands), and tree and shrub encroachment on their habitat. Thread-leaved Sundew is an endangered species of ACPF that is known to occur in only five peatland sites in Nova Scotia, highly disjunct from the main range of this species (EC & PCA 2010). Atlantic Coastal Plain Flora species are constrained by biologically limiting factors, including small population sizes, northern range limitations, and reduced reproductive capabilities, as well as anthropogenic threats, including infilling, peat mining, and commercial cranberry production for peatland associated species (EC & PCA 2010). Conservation of freshwater wetlands within the bioregion will contribute to the conservation of at least 111 priority species.

Nested Conservation Priority Species

- Blanding’s Turtle (EN)
- Snapping Turtle (SC)
- Thread-leaved Sundew (EN)
- Eastern Ribbonsnake (TH)
- Eastern Mountain Avens (EN)
- Long’s Bulrush (SC)

Landscape context assessment of freshwater wetlands: Very Good

Information on the amount of freshwater wetlands occurring in Nova Scotia prior to European settlement is limited; however, historic losses appear to have been high for some types of wetlands. Losses of freshwater wetlands are thought to be highest in the most fertile regions, such as the Annapolis Valley (Government of Nova Scotia 2011). In 2011 the Province of Nova Scotia released the Nova Scotia Wetland Conservation Policy, which provides a direction and framework for the conservation and management of wetlands in Nova Scotia, and identifies specific objectives intended to prevent the net loss of Nova Scotia’s wetlands (Government of Nova Scotia 2011). This policy, administered by Nova Scotia Environment, should help limit any further loss of freshwater wetlands in the province. In addition, current forest harvesting regulations in Nova Scotia require that all forestry operations leave a minimum 20 m forested buffer along watercourses and wetlands, though some level of harvesting is permitted within these buffers.

The average Landscape Context Index\(^1\) for freshwater wetlands in the SWNS bioregion is 2.52, which is very low and considered to be an indication that, on average, the habitat conservation priority is surrounded primarily by natural cover and has good landscape context that will contribute toward the long term viability of the ecosystem type (calculated using

\(^{1}\) Landscape Context Index (LCI) is a measure that refers to the relative amount of development, agriculture, quarries, roads, and other fragmenting features directly surrounding ecosystem occurrences. It provides an estimate of isolation of occurrence as well as potential future encroachment on the occurrence. An LCI below 20 (30 for coastal ecosystems) indicates that the habitat conservation priority is surrounded primarily by natural cover with higher LCIs indicating increasing amounts of development directly surrounding ecosystem occurrences. An LCI above 50 is considered to be high, with individual occurrences usually rejected as critical (Anderson et al. 2006).
NAAP data). In total 23,310 ha (18.3%) of freshwater wetlands in the bioregion are currently under protected or conservation status.

**Condition assessment of freshwater wetlands: Good**

The water quality of wetlands may be impacted by a number of factors including inflowing water and runoff, groundwater inflow, precipitation, and vegetation. Surface waters within the bioregion are generally soft with low buffering capacity, which is typical of water draining from igneous rocks (Kerekes & Schwinghamer 1973). Additionally, freshwater systems in the bioregion have been heavily impacted by acid precipitation originating from industrialized regions of the continent and have some of the most acidic freshwaters in North America (Clair et al. 2001). Acidic precipitation may negatively impact some types of freshwater wetlands, such as nutrient-poor swamps and fens, which do not possess adequate buffering capacity to neutralize acid precipitation (Davis & Browne 1996). The collective impacts of these factors may result in poor water quality for some freshwater wetland dependent species. Certain human activities, including residential and cottage development, forest harvesting, agricultural practices, road construction, infilling, and climate change may impact the hydrology or nutrient flows of freshwater wetlands, which can lead to changes in the vegetation community and potentially impact the ecological integrity of these ecosystems for sensitive species (i.e., Atlantic Coastal Plain Flora). Bogs and fens face the additional threats of peat mining and cranberry production, which significantly degrade these freshwater wetlands, though these anthropogenic activities are localized and not currently widespread throughout the bioregion.

*Figure 1. Freshwater wetlands within the Southwest Nova Scotia bioregion.*
Southwest Nova Scotia Freshwater Wetlands

**Size assessment of freshwater wetlands: Good**

According to the Nova Scotia provincial wetland inventory, there are 127,071 ha of freshwater wetlands in the bioregion, which make up 7.9% of the total area of the bioregion (note that the area of treed swamp is considered underestimated; S. Basquill, per. comm.). Of these freshwater wetlands, 16,369 ha were identified as critical in the NAAP. The screening criterion for the minimum size of critical occurrences of freshwater wetlands was 20 ha (Anderson et al. 2006). A 275 metre buffer was included around freshwater wetlands to protect the ecological functions and integrity of this priority habitat (EC, OMNR & OME 1998). The total area and average size of each of the dominant types of wetlands found in the bioregion is presented in Table 1. The average size of freshwater wetland occurrences is 5.6 ha, which is considerably less than the NAAP minimum size criteria for critical occurrences. Nonetheless, the SWNS bioregion, which makes up 29.3% of the total area of the province, contains 51% of the province’s critical occurrences of freshwater wetlands.

¹ Categories based on IUCN – CMP Unified Classification of Conservation Actions Needed (Version 2.0). Actions are meant to be specific and measurable if possible, and are not listed in order of importance.
² CRITICAL: Conservation actions that, without implementation, would clearly result in the reduction of viability of a biodiversity target or the increase in magnitude of a critical threat within the next 5-10 years. Also includes research information that is needed before key decisions can be made on the management of biodiversity targets. NECESSARY: Conservation actions that are needed to maintain or enhance the viability of biodiversity targets or reduce critical threats. Also includes research that will assist in decisions on management of biodiversity targets. BENEFICIAL: Conservation actions that will assist in maintaining or enhancing viability of biodiversity targets and reducing threats.
³ Priority Habitats: Beaches and dunes, tidal marshes, tidal flats, coastal islands, freshwater wetlands, Acadian forest, riparian/floodplain systems, grasslands/agro-ecosystems, barrens.
### Conservation Actions

#### Description of related action (specific and measurable if possible)

#### 2.1 Site/Area Management

**Description of related action (specific and measurable if possible)**

Spatial layer of sensitive habitats and ecosystems to aid in planning and an action plan for protected area managers.

**Parks Canada through collaboration with many partners**

**Necessary**

**Ongoing**

**All**

#### 2.1 Site/Area Management

**Description of related action (specific and measurable if possible)**

Continue ecological integrity monitoring to assess the state of forest, freshwater, wetland, and coastal ecosystem health in Kejimkujik National Park through the monitoring, analysis, and reporting of approximately 30 measures (e.g., forest birds, salamanders, water quality, Eelgrass) and by summarizing these findings in the *State of the Park Report*.

**NCC**

**Necessary**

**2018**

**All**

#### 2.1 Site/Area Management

**Description of related action (specific and measurable if possible)**

Conduct wildlife connectivity analyses to identify optimal connectivity corridors between core protected areas/natural habitats.

**MTRI, PC**

**Necessary**

**Ongoing**

**Riparian and Floodplain Systems, Freshwater Wetlands**

**1.1 Cottage and residential development**

#### 2.1 Site/Area Management

**Description of related action (specific and measurable if possible)**

Continue to monitor populations of endangered, threatened, and special concern species of ACPF on the 36 high priority lakes identified in the ACPF recovery strategy to complete a full inventory and to document lake-level population changes. Continue to sample water quality on a sub-set of the 36 high priority lakes. Continue to engage volunteers in the monitoring of ACPF and threats along lakeshores in southwest Nova Scotia. In Kejimkujik National Park and National Historic Site, continue annual Water-pennywort surveys on Kejimkujik and George Lakes.

**MTRI, PC**

**Necessary**

**Ongoing**

**Riparian and Floodplain Systems, Freshwater Wetlands**

#### 2.1 Site/Area Management

**Description of related action (specific and measurable if possible)**

Conduct botanical surveys of potential ACPF habitat between Tusket watershed and Queens County.

**ACCDC**

**Necessary**

**2020**

**Tidal Marshes, Freshwater Wetlands, Riparian and Floodplain Systems**

#### 2.1 Site/Area Management

**Description of related action (specific and measurable if possible)**

Conduct insect biodiversity surveys in southwestern Nova Scotia, focusing on the discovery of disjunct species associated with the Atlantic Coastal Plain, including targeted efforts to find species dependent on rare ACPF, such as Sweet Pepperbush and Eastern Baccharis.

**ACCDC**

**Beneficial**

**2020**

**Tidal Marshes, Freshwater Wetlands, Riparian and Floodplain Systems**

#### 2.2 Invasive/Problematic Species Control

**Description of related action (specific and measurable if possible)**

Establish a structure to facilitate collaboration and strategic decision making regarding invasive species control techniques.

**NCC, MTRI**

**Beneficial**

**2020**

**All**

**8.1 Invasive/ alien species/ diseases**

#### 2.2 Invasive/Problematic Species Control

**Description of related action (specific and measurable if possible)**

Raise awareness of invasive species in Nova Scotia and the role they play in ecosystems through the Backyard Biodiversity project.

**PC, MTRI**

**Beneficial**

**Ongoing**

**All**

**8.1 Invasive / alien species/ diseases**

### 3. Species Management

#### 3.1 Species Management

**Description of related action (specific and measurable if possible)**

Continue the long-standing volunteer program to protect Blanding's

**MTRI, PC, EC, Acadia University**

**Necessary**

**Ongoing**

**Freshwater Wetlands, Riparian and**
